

AFOCO Project Document

Project code	AFOCO/013/2020
---------------------	----------------

Project Profile	
Project title	Improving <i>Pinus caribaea</i> Morelet for plantation on degraded land in Viet Nam's northern mountainous region.
Project duration	Estimated start date: 1 st July, 2020 Estimated end date: 31 th December, 2023
Implementing Agency	Forest Science Centre of North-Eastern Viet Nam (FSNE)
Participating countries	Viet Nam
Project site	Northern mountainous region of Viet Nam
Main objective	Improving the productivity and supply of high-quality <i>Pinus caribaea</i> Morelet in order to adapt to climate change and meet raw material requirement for timber processing.
Target Area¹	Primary Target Area: Forest restoration and rehabilitation Secondary Target Area: N/A
Budget and source of finance	Total: US\$ 576,200 - AFOCO: US\$ 486,000 - National: US\$ 90,200 - Others: US\$ _____ (to be specified)
Proponent Profile	
Name/ Position	Dr. Le Minh Cuong Position: Director
	Signature Date
Organization	Forest Science Centre of North-Eastern Viet Nam (FSNE)

SUMMARY

The problems to be addressed

With strongly sloping and craggy topography, Viet Nam's northern mountainous region has been facing the increasing degradation of forest land due to a huge amount of annual average rainfall, from 1,800 to 2,000 mm/year, and unsustainable farming methods. According to the United Nations report, Viet Nam is among some countries that to be the most vulnerable to climate change. Land degradation has become more and more serious in mountainous areas, particularly in northern mountainous region. In order to tackle this situation, Viet Nam has been a signatory to the United Nations Convention to Combat Desertification since 1992. On 2 September 2006, the Government issued the Decision No. 204/2006/QĐ-TTg on promulgating the national action program to combat desertification, which prioritizes the application and transfer of new science and technology to mountainous regions with the aim of enhancing capacity and education as well as raising awareness on "desertification". Desertification and other causes, such as climate change, have led to "land degradation" with the reduction or loss of biological productivity and economic benefits of land which has directly affected lives of people, especially of those who live in high-slope mountainous areas.

Selecting appropriate varieties that can grow on degraded land while maintaining sustainable yield and adapt to adverse effects of climate change is a challenge for scientists. In addition to cultivation solutions and technologies in dry and decertified areas, appropriate varieties have been researched and selected in order to adapt to these harsh conditions. Recognizing the impacts of climate change, with the aim of enhancing the adaptability to climate change to ensure sustainable development, Ministry of Agriculture and Rural Development (MARD) issued the "Framework action plan on climate change adaptation for all bodies involved in agriculture and rural development sector in the 2008-2020 period", with focus on the upland and mountainous areas, which are considered as the most vulnerable to climate change.

Pinus caribaea Morelet (hereinafter referred to as *P. caribaea*) is a fast-growing and good-wood variety which is suitable for plantation of large-timber forest on degraded land in some ecological areas across the country. However, the plantation of *P. caribaea* forests has been facing difficulties due to the lack of improved high-quality *P. caribaea* seedlings. This variety has been tested and grown in many ecological areas and it has some advantages such as rapid growth, easy adaptation to different habitats and good endurance to poor land. Thus, it has been identified as a breakthrough scientific and technological solution to improve the productivity and quality of plantation forests, thereby contributing to the expansion of planted production forests on degraded land which also contributes to the increase of plantation forests, increase of income for people involving in forest plantation in mountainous areas and provision of raw materials for timber processing industry, thereby enhancing value and competitiveness of timber and timber products in the domestic and export markets.

The project will apply value-chain approach ranging from high-quality seedling production, forest plantation, forest product processing to marketing. The project will also develop and replicate demonstration models in localities that have advantages in forestry development, especially in difficult mountainous provinces, in which the project will contribute to income generation and livelihood improvement for local people.

Goals

To develop *P. caribaea* forests on degraded land in northern mountainous region by improving high-quality seedling production, developing intensive cultivation technique and

appropriate *P.caribaea* timber processing and preservation technology to meet market demands and provide raw materials for timber processing industry.

Objectives

- 1) To improve high-quality *P. caribaea* seedling production by selection of at least 150 plus trees from seed orchards and other relevant sources; development of 10ha of transformed seed stands and 4ha of seed orchards; completion of sexual and asexual propagation techniques to create high-quality seedlings and transfer them to production.
- 2) To develop and transfer the guideline of intensive forest plantation to production by plantation of 11ha of model forest from created seedlings.
- 3) To propose and develop appropriate techniques to use *P. caribaea* timber in timber processing industry to meet market demands.

Interventions needed to resolve the problem

The project is implemented on the basis of value chain from seedling production, forest plantation, and forest product processing to marketing.

The supply of seedlings is improved through the application of science and technology into propagation methods by seeds, cuttings and tissue culture; the establishment of seed orchards to provide high-quality seeds; manpower training and technology transfer to forestry organizations and businesses for application into forest production and business.

Selected seedlings are used and appropriate silvicultural methods are applied into the plantation of *P. caribaea* forest to supply large timber.

The value of *P. caribaea* timber is enhanced through market research (with focus on Korean market) and application of appropriate processing and preservation techniques, 1 to 2 sample products made of *P. caribaea* timber that meet market demands are initially processed.

Trainings on transfer of technical guideline of high-quality seedling production, intensive forest plantation and *P. caribaea* timber processing technology to forestry organizations and businesses in the region are carried out.

SECTION A. PROJECT CONTEXT

1. Background

In previous years, in spite of difficulties, Viet Nam has been making great efforts to re-forest barren land and bare hills, increase forest cover, gradually restore poor natural forests to better-quality forests. Annually, Viet Nam has grown nearly 230,000 ha of concentrated plantation forests, of which more than 90% of area is production forests in order to supply raw materials for timber processing industry. However, due to land degradation, poor nutrition and severe climate combined with backward extensive farming practices, the access to and effective application of advanced technologies remain limited. Moreover, the productivity of plantation forests remains low, only 8-10m³/ha/year for the reason that the quality of seedlings is not up to standard. Therefore, it is urgent to research technical measures to select high-quality seedlings in order to increase productivity of forests planted on degraded land.

Raw materials from domestic plantation forests do not meet the increasingly high demands for materials for timber processing industry in general and for exported timber processing in particular. As estimated by Viet Nam Timber and Forest Product Association, total volume of plantation timber of 2017 is expectedly reached 23 million m³ of logs, but most of this output is used for production of woodchip, meanwhile less than 20% is used for lumber production. As such, one of top priorities of Viet Nam's forestry sector is to improve quality of seedlings in order to create high-yield plantation forests and supply high-quality raw materials for timber processing industry.

So as to meet the increasing demand for timber, especially large timber for furniture production, forest plantation has been carried out for many years but the productivity and economic efficiency of plantation forests has been remained low due to backward farming practices and increase of degraded land area. Thus, on 16 June 2017, the Prime Minister issued the Decision No. 886/QD-TTg on approval of the target program for sustainable forest development for the period 2016-2020. As regulated in the Decision, key objectives include: afforestation and post-harvesting reforestation: 1,025,000ha, including 200,000ha of intensive plantation forests for large timber; transformation from small-timber plantation forests into large-timber plantation forest: 90,000ha; the proportion of plantation forests under the control of seed quality: 75-80%. Forest production is organized by supply chain from plantation, raw material purchase, processing and marketing.

P. caribaea, which is naturally distributed in the Caribbean countries and islands, is a photophilic species, having large timber with the diameter of over 100cm. This species has been early introduced and planted in the country. It has been shown that this species has superior characteristics than other native pine species such as rapid growth, good stem shape and good resistance to insects and diseases (Phi Quang Dien, 1989; Phan Thanh Huong, 2002). Through the study on the plantation of *P. caribaea* on some soil types in the Northeast region in the period 2000-2004, which was carried out by Forest Science Centre of North-Eastern Viet Nam, 25ha of *P. caribaea* forest have been planted in 5 Northeastern provinces, including Cao Bang, Lang Son, Thai Nguyen, Bac Giang and Vinh Phuc. The study also showed that *P. caribaea* species has been well grown on poor barren land and bare hills and its growth is faster than *P. kesiya* and *P. massoniana* Lamb species of the same age.

P. caribaea variety planted in Viet Nam is *P. caribaea* var *hondurensis*, which has been selected for research in Dai Lai – Vinh Phuc since 1968 based on the assessment that this variety is the best-growing mutation. This variety has been selected and recognized as

technically advanced seedling (according to the Decision No. 3614/QD-BNN- KHCN dated 8 August 2001 by Minister of MARD). Despite its potential growth, this species has not been widely planted due to the lack of high-quality seed sources because of the limitation of seeds from seed orchards. Thus it is essential to research and develop *P. caribaea* seedlings in order to ensure improved seedlings for forest plantation.

P. caribaea was planted on almost area of the FSNE and the mean annual increment in volume of 30m³/ha/year at 10 years of age. In the report of technologies and sciences summary for project “Scientific and technical solutions for wood material development for export” (Nguyen Huy Son, 2006), *P. caribaea* was intensively planted with density of 1,330 trees/ha, the average increment is 4.7cm in diameter and 2.3m in high after 2.5 years. The result in the other research on intensive planting techniques system of *Acacia*, *Eucalyptus* and *P. caribaea* for supplying large timber pointed out that the accordance density is 1,100 trees/ha and the growth can reach 17m³/ha/year at 4 years of age, the results also indicate that *P. caribaea* can be planted in the site with the lowest absolute temperature of 6-12°C.

This proposed project is relevant to the forestry and wood industry development policies of VietNam.

Following are the key policies that are in favor of project implementation:

- ✓ Decision No. 57/QD-TTg dated 09 January, 2012 of the Prime Minister “Approving the Forest Protection and Development Plan 2011-2020”
- ✓ Decision No. 774/QD-BNN-TCLN dated 18 April, 2014 of the Ministry of Agriculture and Rural Development “Approve the Action Plan to improve the productivity, quality and value of planted forests in the period 2014-2020”
- ✓ Decision No. 4961/QD-BNN-TCLN dated 17 November, 2014 of the Ministry of Agriculture and Rural Development “Promulgating the list of major species for forest plantation and main species for plantation in each environmental region”
- ✓ Decision No. 886/QD-TTg dated 16 June, 2017 of the Prime Minister “Program for Sustainable Forestry Development for the period 2016 – 2020”.

Based on that fact, the project is very necessary to help Viet Nam select appropriate seedlings for plantation of high-yield forest on degraded land in the northern mountainous region. This project will contribute to increasing effectiveness of forest plantation, improving livelihoods of local people, mitigating and adapting to negative impacts of climate change, ensuring the harmony between environmental protection and livelihood maintenance.

2. Conformity with AFoCO’s objectives and strategic priorities

The vision of the Asian Forest Cooperation Organization (AFoCO) is to contribute to enhancing regional forestry cooperation in terms of technology and policy through specific activities for a greener Asia. As an inter-governmental organization, AFoCO will establish a legal framework and develop capacity to implement cooperative activities in the forestry sector towards sustainable development. Cooperative activities will be implemented in medium and long-term periods. All cooperative activities are inter-related and synchronously carried out.

Deforestation and forest degradation are common problems in many countries around the world. Most of Asian countries, except for a small number of countries, have experienced lesson-learnt from the reduction of forest cover over many years due to the shift from forest land into agricultural and industrial purposes, population growth and other land use purposes leading to deforestation which is considered as a major contributor to global warming. Within the global efforts to prevent deforestation and forest degradation, AFoCO will develop and implement key activities to contribute to this course.

With the aim of strengthening sustainable forest management in environmental, economic and social aspects, AFoCO will help reduce deforestation and desertification which are caused by human activities and climate change. AFoCO will address challenges for sustainable development and livelihoods of millions of people in the course of hunger elimination and poverty reduction. Besides, AFoCO takes into consideration the important roles of capacity building and technology transfer in the development process of many developing countries. Limited capacity will be a deterrent to the development of the country. AFoCO will boost the cooperation among regional countries to support the development of member countries.

Based on priorities of member countries, AFoCO Council has endorsed the AFoCO Strategic Plan for the 2018-2022 period. Accordingly, the following 5 priority areas have been set out to strengthen cooperation among member countries, contributing to the development of the forestry sector in the region:

- Initiating customized reforestation models
- Supporting research and development in climate change adaptation approaches
- Introducing systematic management on forest-related disasters
- Local livelihood improvement through forest-related activities
- Strengthening organizational capabilities and regional actions

In accordance with AFoCO's orientation, the project focuses on establishment of seedling supply system for forest plantation and development of rehabilitation model of forests planted on degraded land aiming at improving livelihoods of local people and adapting to negative impacts of climate change. Therefore, this project proposal is in line with the priority area 1 of the AFoCO Strategic Plan in the 2018-2022 period which is forest restoration and rehabilitation.

3. Regionality

Southeast Asia is the region with the highest rate of deforestation in the world, which has lost 14.5% of its forest area over the past 15 years, and may have lost more than 50% of its natural forest cover. The main cause leading deforestation is the conversion forest land to agricultural purpose. In addition, planning to build hydroelectric power plants of the countries on the Mekong River in the future will strongly decrease the forest area in this region. That can reduce the number of plant and animal species in the region by 20-70%.

Facing the same disadvantage condition as countries in the region, Viet Nam is one of the most affected countries by global warming and sea level rising in the world that causes a large area of Viet Nam's coastal sinking under the water. Beside that the flood and drought are appeared with high frequency, which is the cause reducing the productivity of plant in this area, directly affecting to income of the local people living in the mountainous area. This problem is a top priority of the government, to deal with these challenges the government issued lot of solutions about sciences and technology to mitigate and adapt to climate change.

One of the solutions is to select and create the new species which can withstand with the hard environment.

P. caribaea can grow on harsh sites and a drought tolerance species which is one of the key species on the priority list for afforestation in the northern mountains area of Viet Nam.

The project proposal aims to rehabilitate plantation forest ecosystem by planting improved high-quality seedlings on degraded land in the north of Viet Nam as well as in Mekong sub-region countries which have similar natural conditions to Viet Nam in order to adapt to climate change. When the project is completed, project technical staff can exchange experience with regional countries on plantation and rehabilitation of forests on degraded land. Additionally, improved seedlings will be widely introduced so as that they are able to be developed to increase the productivity of plantation forests and rehabilitate forests on degraded land. Plantation and rehabilitation of degraded forest regions is an urgent issue for Southeast Asian countries, so the project demonstration model and lesson-learnt which will be applied for the local farmers and also for the other regions which have the same environmental site condition for increasing farmers' knowledge of intensive planting for the high economic value purpose and adaptation to the hard environmental conditions in the current years. The experiences and lessons learnt from implementation project will be shared through international conferences and publications that would be of great significance for exchanging and sharing with countries in the Mekong sub-region.

4. Information on project target area

4.1. Geographic information

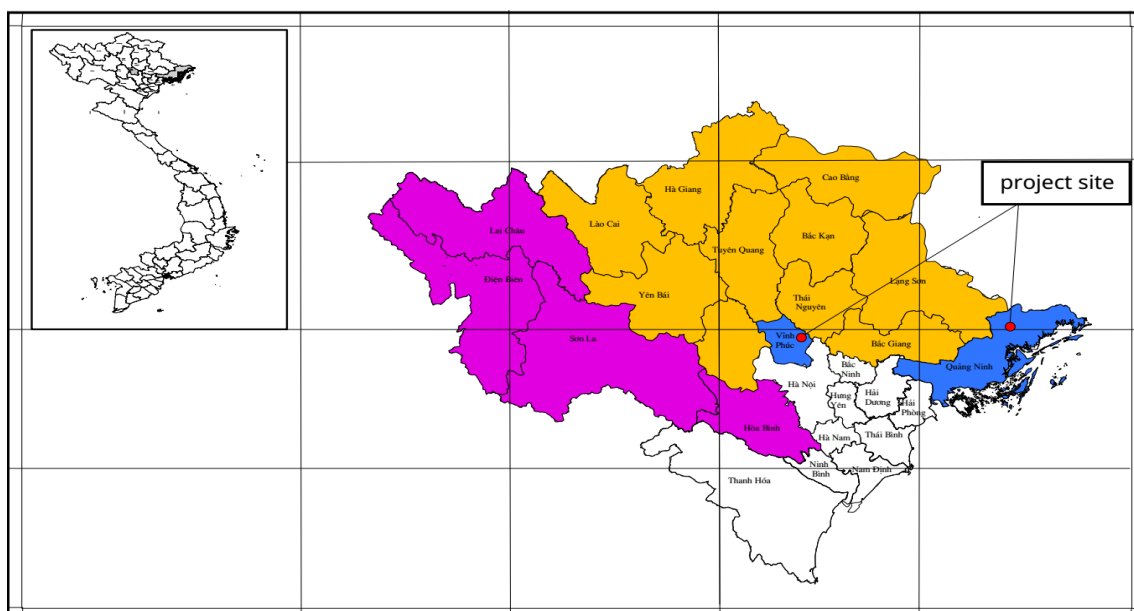

Figure 1. Map of the project site location

The northern mountainous region contains both medium and high mountains. This is the highest, craggiest and most fragmented terrain of Viet Nam. The common topographies are

high mountain ranges, deep valleys, medium-high limestone plateaus. The highest mountain range is Hoang Lien Son with many peaks above 2,500 m and the highest peak is Fansipan with the height of 3,143m (above sea level).

There are 15 provinces in the region, including: Ha Giang, Cao Bang, Lao Cai, Bac Kan, Lang Son, Tuyen Quang, Yen Bai, Thai Nguyen, Quang Ninh, Phu Tho, Bac Giang, Lai Chau, Dien Bien, Son La, Hoa Binh. The regional centers are the city of Thai Nguyen and the city of Viet Tri. Total area of the region is 9,526,440 ha, accounted for 29.2% of total area of the country. The area of forested land is 5,612,045 ha, accounted for 42.67% of total forested land of the country, of which the area of natural and plantation forests is 4,474,004 ha and 1,138,041 ha, respectively.

Soil in the region is mostly feralit on shale, limestone and other mother stones together with ancient alluvium (in midland) and alluvial soil along valleys of rivers. Feralit soil in the region has thick weathering layer and is rich in mineral elements such as iron, manganese, which is suitable for growing forest and industrial trees.

4.2. Environmental information

The northern mountainous region has tropical monsoon climate with the annual average temperature of 25-26°C, rainfall of 1,400-1,600mm, and total radiation from 8,500–9,000°C which is appropriate for tropical agro-forestry production. The climate is divided into hot and cold seasons, of which the winter lasts from November to May with the average temperature of below 13°C. The climate in the region is strongly influenced by the northeast monsoon that makes the region a coldest winter in the country.

In addition, the weather in the region is complex and disturbing, frost and heavy cold directly affect the productivity of crops. Meanwhile, the complexity of climate requires investment in research to develop a crop structure that meets ecological condition.

4.3. Socio-Economic information

Population and labour forces

Currently, the population and labour forces in the northern region are rather crowded with the density of 100 - 300 people/km² because this region is continuously supplemented with labours from the Red River Delta, who are experienced in the agricultural production, which is the driving force for regional economic growth. This region is also inhabited by some ethnic minorities such as Tay, Nung, Thai, Muong, Dao with diversified cultures, customs and cultivation experience. However, this region is still lacking skilled labor forces, especially in the border areas. Furthermore, the population and labor forces distribute differently in the region, and mostly focusing in cities and towns. The regional economic structure is backward and slowly moving, the value of industrial production within the GDP structure is less than 30%. The average income per capita remains the lowest, about 500 USD, according to statistics in 2010, while the average income per capita of the whole country is 1,300 USD. According to the Resolution No. 30a/2008 NQ-CP, this region contains a lot of poor households, which accounts for 29.3% of total population. The backwardness and shifting cultivation are still happening in some ethnic groups.

Infrastructures

The region has been early invested, so its infrastructure has been relatively developed, particularly in urban areas. The regional transportation network includes both important national highways and old railway lines such as Ha Noi – Lang Son, Ha Noi – Lao Cai, etc.

[Attachment-A]

Some important urban areas, industrial centers in the region such as Ha Long, Thai Nguyen, Viet Tri, etc. with diversified industrial structure and key industries have been built. In agriculture, many specialized areas of large-scale and high-yield industrial crops such as tea, sugarcane, peanut, etc. have been established. These areas are the basis for production of agricultural materials pushing the development of the processing industry.

Yet, the generally poor and backward regional infrastructure system in terms of technology, especially in remote areas, has directly affected the development and economic growth of the region over the past years.

SECTION B. RATIONALE AND OBJECTIVES

1. Rationale

1.1. Stakeholder analysis

Table 1 Stakeholder analysis table

Stakeholder group	Characteristics	Problems, needs, interests	Potential benefits	Involvement in the project
<i>Primary stakeholders</i>				
Local people and forest owners at the project target area	<ul style="list-style-type: none"> - Have land and facilities for forestry activities - Labors involved in forestry activities 	<ul style="list-style-type: none"> - Degraded land - Low productivity of forests - Lack of good seedlings - Lack of intensive forest plantation guideline - Low income from forests 	<ul style="list-style-type: none"> - Increase productivity of forests - Increase income from forests (using high quality of seedlings, applying new technical of intensive planting) - Increase area of plantation forests 	<ul style="list-style-type: none"> - Participate in workshops, training courses - Participate in implementation project and could get great benefits from the activities and results of the Project
Forestry companies	Have land and facilities for forestry activities	<ul style="list-style-type: none"> - Degraded land - Low productivity of forests - Lack of good seedlings - Lack of intensive forest plantation guideline 	<ul style="list-style-type: none"> - Increase productivity of forests (using high quality of seedlings, applying new technical of intensive planting, also to get good prices after harvesting due to good processing techniques and market created by the Project) - Increase area of plantation forests 	Participate in workshops, training courses and implementation project
Forest Science Centre of North-Eastern Viet Nam and research	- Have researchers, equipment needed for research and site	<ul style="list-style-type: none"> -Inadequate capacity for supply of high-quality seedlings - Lack of 	<ul style="list-style-type: none"> - Strengthen capacity for the production and supply of high-quality 	Develop technical guideline and guidelines for workshops and

Stakeholder group	Characteristics	Problems, needs, interests	Potential benefits	Involvement in the project
institutes under Vietnamese Academy of Forest Sciences	for construction of demonstration model - Participate in training and transferring techniques and sciences	finance for supporting activities	seedlings -Having experiences in scientific research and technology transfer	training courses
<i>Secondary stakeholders</i>				
VNFOREST, Department of Agriculture and Rural Development and Forest Protection Department of Vinh Phuc and Quang Ninh provinces	- Lack of updated information on high-quality seedlings - Concern about seedlings and degraded land	- Update database on high-quality seedlings and degraded land - Create link between scientists and local people	- Update sustainable forest protection and management plan - Increase State management capacity on forestry seedlings and forestry land	- Collaborate during the project implementation - Provide and update policy guidelines
<i>Tertiary and other stakeholders</i>				
Wood region market	Involved in timber trading activities	-Incontrollable the price of timber - Insufficient supply of timber products with the quality demanded by the international markets	- Motivate forestry activities in the region - As the focal point for supplying wood to the market	Using timber from project for wood processing
Region Wood processing	Sawmilling and drying facilities	- Lack of wood material for processing - Lack of investment capital; -Low-level sawmilling and drying technology. -Poorly trained personnel	- Motivate forestry activities in the region - Willing to receive and apply new science, technology and equipment	Using wood from project for processing

Stakeholder group	Characteristics	Problems, needs, interests	Potential benefits	Involvement in the project
Local government	<ul style="list-style-type: none"> - Management of forest activities, motivation for developing forest activities in the region - Responsible for planning and implementing of development plans 	<ul style="list-style-type: none"> - Update database on site condition of the region - Creating relationship between the farmer and scientist - Require technical support to implement regional forest development policies 	<ul style="list-style-type: none"> - Update sustainable forest protection and management plan - Increase State management capacity on forestry seedlings and forestry land - Managing and developing resources 	<ul style="list-style-type: none"> - Provide and update policy guidelines - Cooperating on project implementation

1.2. Problem analysis

Degraded land in combination with traditional cultivation without applying intensive techniques and using selected seedlings have led to low productivity of planted forests. Those are main reasons for poor productivity of planted forests and low production efficiency per a unit of area which still exists in the current forestry production. It is great that the 5 Million Hectare Reforestation Program, which was successfully implemented in Viet Nam, has strongly proven the role of high-quality seedlings to the successful and valuable plantation forests. Improving seedlings is considered as a science technology solution in order to increase productivity and quality of planted forests, contributing to the course of hunger elimination and poverty reduction in upland and mountainous areas as well as reducing the proportion of imported timber in the timber processing industry, thereby increasing the value of Viet Nam's timber processing industry.

The project will help address those constraints by increasing productivity of planted forests through improving seedlings and promoting intensive plantation of *P. caribaea* which is one of imported species suitable for plantation on degraded land in the north of Viet Nam.

The project will focus on 1) silviculture solution to rehabilitate forests on degraded land and 2) using selected seedlings to increase the productivity of planted forests.

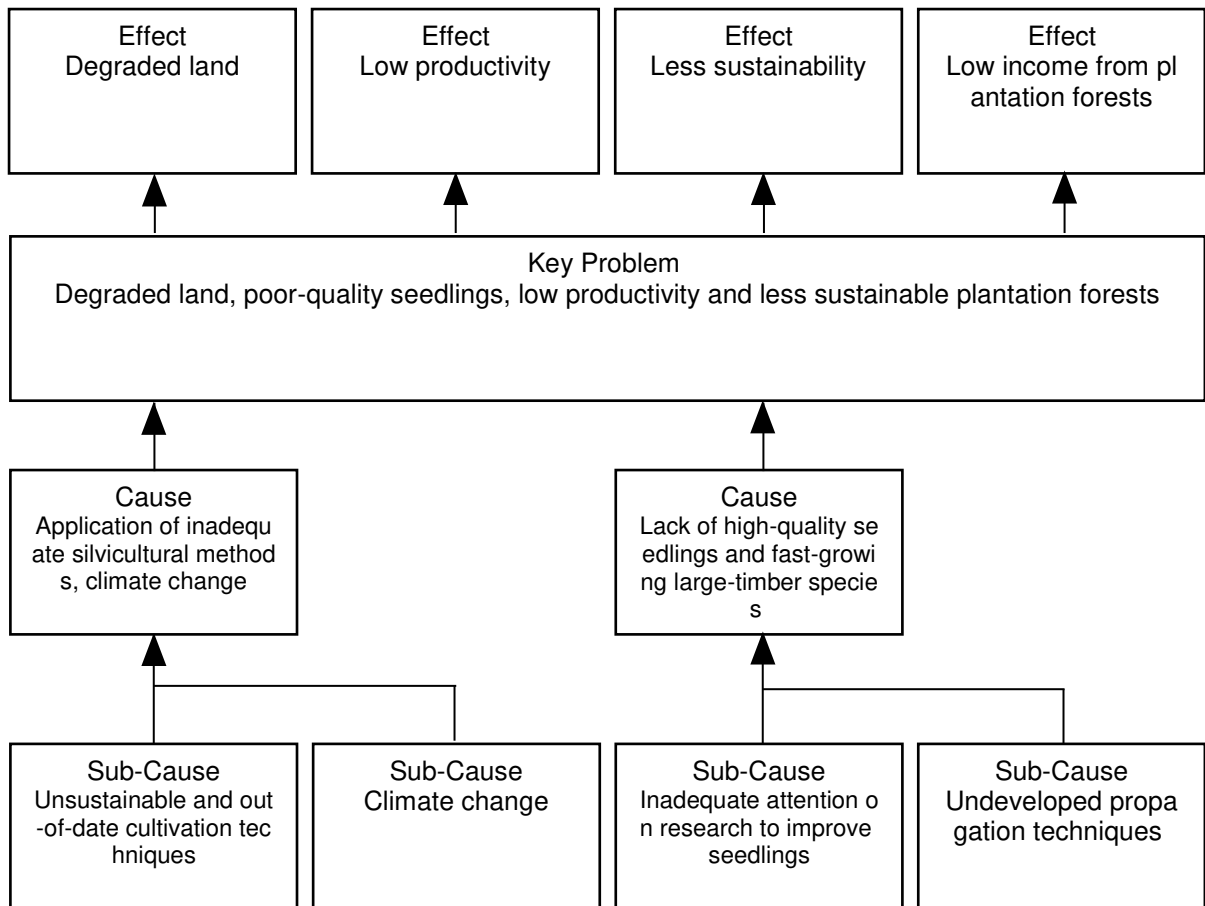

Figure 2. Problem tree

1.3. Logical framework matrix

Table 2. Logical framework matrix

	Narrative	Objectively Verifiable Indicators	Means of Verification	Assumptions
Objective 1	Improve seedling production capacity			
Output 1	Select plus trees and collect seeds (150 plus trees)			
A.1	Survey and assess the origin, growth, phenology, pests and diseases, and growing techniques of planted forest, seed stand and seed orchard of <i>P. caribaea</i>	Report	Surveyed sites are accessible. Surveyed data can be checked and verified (conduct survey in Vinh Phuc, Ha Noi, Son La, Bac Giang, and Quang Ninh...)	Planted forests are not damaged. Forest area is large enough, forests have different ages (5, 10, 15...)
A.2	Select plus trees	150 plus trees	Plus trees ensure their dominance among others inside forest stand; information on plus tree growth and position is described	Selected forest stands are not exploited. Plus trees are well managed and protected.
A.3	Monitor and describe the phenological characteristics, and collect seeds from selected plus trees	Seeds are collected from plus trees	Profile of seed collected from plus trees is described and stored	Plus trees are flowered at the time of collecting
A.4	Store, preserve and assess periodically quality of seeds	Report	Seeds are collected, processed and stored. Data on seed germination is stored	Seeds are properly stored, germination is periodically checked
Output 2	Establish seed orchards and transformed seed stands (transgenic seedling forest)			
B.1	Germinate seeds collected from plus trees for experimental plantation	Seed lot	Seeds are separately germinated with different	Seeds are separately stored

	Narrative	Objectively Verifiable Indicators	Means of Verification	Assumptions
			codes	
B.2	Establish seed orchards	04ha/2 orchards	Seed orchard is established at a place where seedlings are likely to flower in accordance with Vietnamese standard (TCVN)	It is necessary to ensure the minimum number of seeds per lot and the number of seedlings per seed lot in accordance with TCVN
B.3	Establish transformed seed stand	10ha	Origin of seedling forest is from good seeds or from mixture of plus trees, transgenic technique is compliant with TCVN	Transgenic stand meets requirements of TCVN
Output 3	<i>Improve the propagation techniques of P. caribaea by seeds, cuttings and grafting</i>			
C.1	Improve propagation techniques by seeds	Technical Guideline	The guideline is based on scientific experiments with detailed description of steps and stages of production process which can be replicated and applied into actual production	The guideline is based on full scientific experiments
C.2	Improve propagation techniques by cuttings	Technical Guideline	The guideline is based on scientific experiments with detailed description of steps and stages of production process which can be replicated and applied into actual production	The guideline is based on full scientific experiments
C.3	Improve propagation techniques by grafting	Technical Guideline	The guideline is based on scientific experiments with detailed description of steps and stages of production	The guideline is based on full scientific experiments

	Narrative	Objectively Verifiable Indicators	Means of Verification	Assumptions
			process which can be replicated and applied into actual production	
C.4	Provide training courses on propagation methods for technical staffs	02 training courses for 20 technical staffs	Technical staff are able to capture technological processes and apply them into actual production	Technical staff are trained
Output 4	<i>Conduct communication activities, capacity building and awareness raising on seed production</i>		<i>Materials for workshop, trainings are transferred and promoted</i>	<i>Participants are able to understand common techniques</i>
D.1	Training and experience sharing for stakeholders	02 training courses		
Objective 2	Develop and transfer the guideline of intensive forest plantation for production; develop pilot models from created seedlings			
Output 5	<i>Determine suitable sites to plant <i>P. caribaea</i> in the northern mountainous region</i>			
E.1	Collect available information and data relating to sites to plant <i>P. caribaea</i>	Report	Surveyed sites are accessible. Surveyed data can be checked and verified	Planted forests are not damaged. Forest area is large enough
E.2	Survey suitable sites to plant <i>P. caribaea</i> (natural conditions, soil, etc.)	Report	Table of natural conditions at the planting sites is prepared Soil samples at surveyed sites are analysed.	Forest area is large enough
E.3	Develop criteria and scale of soil conditions for planting <i>P. caribaea</i> (site map for planting <i>P. caribaea</i>)	Report	Site map of <i>P. caribaea</i> forest is prepared	Area of plantation forests on different soil types
Output 6	<i>Develop model forest plantation (with mix and pure plantation) on degraded land, plantation of NTFPs</i>		<i>Plantation model must meet requirements of TCVN</i>	<i>Model forest must meet requirements of TCVN</i>

	Narrative	Objectively Verifiable Indicators	Means of Verification	Assumptions
	<i>and native species under forest canopy of P. caribaea</i>			
F.1	Survey to select suitable sites and design plantation models of <i>P. caribaea</i>	11ha		
F.2	Develop pure plantation model of <i>P. caribaea</i> to provide sawlog	4ha		
F.3	Develop of mixture plantation model	3ha		
F.4	Develop model to plant NTFPs species under forest canopy of <i>P. caribaea</i>	2ha		
F.5	Develop model to plant native species under the forest canopy of <i>P. caribaea</i>	2ha		
Output 7	<i>Provide technical training on forest rehabilitation, determination of soil/site conditions for planting P. caribaea</i>		<i>Trainees are able to capture technological processes and apply them into actual production</i>	<i>Trainees are trained</i>
G.1	Technical training on determination of soil/site conditions for planting <i>P. caribaea</i>	2 training courses		
G.2	Technical training on forest rehabilitation	2 training courses		
Output 8	<i>Conduct activities of communication, capacity building and awareness raising on intensive forest plantation</i>		<i>Materials for workshop, trainings are transferred and promoted</i>	<i>Participants are able to understand common techniques</i>
H.1	Training and experience sharing for stakeholders	2 training courses		
Objective 3	Develop appropriate techniques to process and preserve and use <i>P. caribaea</i> timber to meet the market requirements			
Output 9	<i>Survey and access markets of pine</i>			

	Narrative	Objectively Verifiable Indicators	Means of Verification	Assumptions
	<i>wood and P. caribaea timber inside and outside the country</i>			
I.1	Survey, evaluate the consumption of pine wood and <i>P. caribaea</i> timber at the timber processing centers in the north, central and south regions	Report	Surveyed sites are accessible. Surveyed data can be checked and verified	There is source to supply pine wood to the market
I.2	Survey, evaluate markets of <i>P. caribaea</i> timber inside and outside the country	Report	Surveyed sites are accessible. Surveyed data can be checked and verified	<i>P. caribaea</i> timber is used at these markets
Output 10	<i>Complete P. caribaea timber preservation techniques</i>			
J.1	Temporary post-harvesting wood preservation technique	Technical Guideline	The guideline is based on scientific experiments with detailed description of steps and stages of production process which can be replicated and applied into actual production	The guideline is based on full scientific experiments
J.2	Post-sawing timber preservation technique for making woodworking joints	Technical Guideline	The guideline is based on scientific experiments with detailed description of steps and stages of production process which can be replicated and applied into actual production	The guideline is based on full scientific experiments
Output 11	<i>Develop techniques to produce P. caribaea finger joint boards</i>			
K.1	Develop technique to produce <i>P. caribaea</i> finger joint boards	Technical Guideline	The guideline is based on scientific experiments with detailed description of steps and stages of production process which can be	The guideline is based on full scientific experiments

	Narrative	Objectively Verifiable Indicators	Means of Verification	Assumptions
			replicated and applied into actual production	
K.2	Develop technique to produce <i>P. caribaea</i> thin wood/veneer	Technical Guideline	The guideline is based on scientific experiments with detailed description of steps and stages of production process which can be replicated and applied into actual production	The guideline is based on full scientific experiments
Output 12	<i>Conduct activities of communication, capacity building, awareness raising on preservation and processing of post-harvesting P. caribaea timber</i>		<i>Materials for workshop, trainings are transferred and promoted</i>	<i>Participants are able to understand common techniques</i>
L.1	Training and experience sharing for stakeholders	2 training courses		
Goal	Develop <i>P. caribaea</i> forests on degraded land in northern mountainous region by improving high-quality seedling production, developing intensive cultivation techniques and appropriate <i>P. caribaea</i> timber processing and preservation technology to meet market demands and provide raw materials for timber processing industry			

1.4. Justification

For degraded land, *P. caribaea* is a top priority because this species has been researched and experimentally planted on different soil types in the northern mountainous region. It is also well developed in places where have difficult conditions.

In order to improve the productivity of planted forests, selection of appropriate seedlings and application of advanced silvicultural techniques are feasible and necessary scientific solutions. Good seedlings will bring highly effective plantation forests and application of advanced silvicultural techniques will shorten business cycle and increase the productivity of planted forests.

The project will increase the capacity of high-quality seedling production and supply, new cultivation methods to be introduced and transferred will be effective tools and solutions to degraded land.

Main contents of the project will be addressed via field activities and by experienced research staff. Through trainings on seedling creation in combination with modern infrastructures and facilities, forest plantation will be provided with high-quality sources. The project results will be transferred to beneficiaries through trainings and workshops.

2. Objectives

2.1. Main objective (development objective)

To develop *P. caribaea* forests on degraded land in northern mountainous region by improving high-quality seedling production, developing intensive cultivation techniques and appropriate *P. caribaea* timber processing and preservation technology to meet market demands and provide raw materials for timber processing industry.

2.2. Specific objectives and success criteria & indicators

- 1) To improve high-quality *P. caribaea* seedling production by selection of at least 150 plus trees from seed orchards; development of 10ha of transformed seed stands and 4ha of seed orchards; completion of sexual and asexual propagation techniques to create high-quality seedlings and transfer them to production.
- 2) To develop and transfer the guideline of intensive forest plantation to production; develop 11ha of model forest from created seedlings.
- 3) To develop appropriate techniques to preserve *P. caribaea* timber to meet market demands.

SECTION C. DESCRIPTION OF PROJECT INTERVENTIONS

1. Work Plan and Schedule

Outputs	Performance Indicator	Responsible Person/ Body	Annual Timeline																Remark
			2020				2021				2022				2023				
			Q1	Q2	Q3	Q4	Q1	Q2	Q3	Q4	Q1	Q2	Q3	Q4	Q1	Q2	Q3	Q4	
Objective 1. Improve seedling production capacity																			
Output 1. Selection of plus trees and collection of seeds																			
<i>A.1. Survey and assess the origin, growth, phenology, pests and diseases, and growing techniques of planted forest, seed stand and seed orchard of P. caribaea</i>	<i>Report</i>	<i>FSNE</i>																	
<i>A.2. Select plus trees</i>	<i>150 plus trees</i>	<i>FSNE</i>																	
<i>A.3. Monitor and describe the phenological characteristics and collect seeds from selected plus trees</i>	<i>Report</i>	<i>FSNE</i>																	
<i>A.4. Store, preserve and assess periodically quality of seeds</i>	<i>Report</i>	<i>FSNE/ FTIBRI</i>																	
Output 2. Establishment of seed orchard and transformed seed stand																			
<i>B.1. Germinate seeds collected from plus trees for experimental plantation</i>	<i>Seed lot</i>	<i>FSNE</i>																	
<i>B.2. Establish seed orchards</i>	<i>04 ha</i>	<i>FSNE/ FTIBRI</i>																	
<i>B.3. Establish transformed seed stand</i>	<i>10 ha</i>	<i>FSNE</i>																	

Outputs	Performance Indicator	Responsible Person/ Body	Annual Timeline																Remark
			2020				2021				2022				2023				
			Q1	Q2	Q3	Q4	Q1	Q2	Q3	Q4	Q1	Q2	Q3	Q4	Q1	Q2	Q3	Q4	
Output 3. Improve the propagation techniques of <i>P. caribaea</i> by seeds, cuttings and grafting																			
<i>C.1. Improve propagation techniques by seeds</i>	<i>Technical Guideline</i>	<i>FSNE</i>																	
<i>C.2. Improve propagation techniques by cuttings</i>	<i>Technical Guideline</i>	<i>FSNE/ FTIBRI</i>																	
<i>C.3. Improve propagation techniques by grafting</i>	<i>Technical Guideline</i>	<i>FSNE/ FTIBRI</i>																	
<i>C.4. Provide training courses on propagation methods for technical staffs</i>	<i>2 courses for 10 technical staffs each</i>	<i>FSNE/ FTIBRI</i>																	
Output 4. Conduct activities of communication, capacity building and awareness raising on seed production																			
<i>D.1. Training and experience sharing for stakeholders</i>	<i>2 courses for 20 technical staffs each</i>	<i>FSNE/ FTIBRI</i>																	
Objective 2. Develop and transfer the guideline of intensive forest plantation for production; develop pilot models from created seedlings																			
Output 5. Determine suitable sites to plant <i>P. caribaea</i> in the northern mountainous region																			
<i>E.1. Collect available information and data relating to sites to plant <i>P. caribaea</i></i>	<i>Report</i>	<i>FSNE</i>																	
<i>E.2. Survey suitable sites to plant <i>P. caribaea</i></i>	<i>Report</i>	<i>FSNE</i>																	
<i>E.3. Develop criteria and scale of site conditions for planting <i>P. caribaea</i></i>	<i>Report</i>	<i>FSNE</i>																	

Outputs	Performance Indicator	Responsible Person/ Body	Annual Timeline																Remark
			2020				2021				2022				2023				
			Q1	Q2	Q3	Q4	Q1	Q2	Q3	Q4	Q1	Q2	Q3	Q4	Q1	Q2	Q3	Q4	
Output 6. Develop model forest plantation (with mix and pure plantation) on degraded land, plantation of NTFPs and native species under forest canopy of <i>P. caribaea</i>																			
<i>F.1. Survey to select suitable sites and design plantation models of <i>P. caribaea</i></i>	<i>Report</i>	<i>FSNE</i>																	
<i>F.2. Develop pure plantation model of <i>P. caribaea</i> to provide sawlog</i>	<i>04 ha</i>	<i>FSNE</i>																	
<i>F.3. Develop of mix plantation model</i>	<i>03 ha</i>	<i>FSNE</i>																	
<i>F.4. Develop model to plant NTFPs under forest canopy of <i>P. caribaea</i></i>	<i>02 ha</i>	<i>FSNE</i>																	
<i>F.5. Develop model to plant native species under the forest canopy of <i>P. caribaea</i></i>	<i>02 ha</i>	<i>FSNE</i>																	
Output 7. Provide technical training on forest rehabilitation, determination of soil/site conditions for planting <i>P. caribaea</i>																			
<i>G.1. Technical training on determination of soil/site conditions for planting <i>P. caribaea</i></i>	<i>2 courses for 20 technical staffs each</i>	<i>FSNE</i>																	
<i>G.2. Technical training on forest rehabilitation</i>	<i>2 courses for 20 technical staffs each</i>	<i>FSNE</i>																	
Output 8. Conduct activities of communication, capacity building and awareness raising on intensive forest plantation																			
<i>H.1. Training and experience</i>	<i>2 courses</i>	<i>FSNE</i>

IN-CASH CONTRIBUTION FROM VIET NAM (costs for PMU, equipment, auditing, M&E, miscellaneous, etc.)				73.000					
IN-KIND CONTRIBUTION FROM VIET NAM (costs for office renovation package, instruments for field,etc.)				17.200					
GRANT TOTAL				576.200					

Note:

~~The total budget of activities are increased by USD 153.658~~

~~The total budget of activities are decreased by USD 153.658~~

[Attachment-A]

The budget of Common Expenses of Project (58.000 USD) will be covered by national contribution, with clarification as below:

- The car hiring section in proposal is considered as 28.000 USD which was divided into the activity in objectives. It means to be no more “travel” section in the project document; and,
- The auditing activity in proposal is 10.000 USD that doesn't appear in the project document caused this activity is ensured in national grant from Viet Nam; and,
- The PSC and PMU meeting activity in proposal is 20.000 USD that doesn't appear in the project document caused by the budget of this activity is ensured in national grant from Viet Nam.

Obviously, the targets are the same.

2.2 National Budget of Viet Nam (In-cash)

Activity	Budget from Viet Nam (in-cash)				
	TOTAL	Year1	Year2	Year3	Year4
I. Common expenses of project	32.475	7.734	9.494	8.590	6.657
II. Consumable items	22.825	22.825			
III. Travel expenses	5.030	1.262	1.275	1.662	831
IV. Workshops and training courses (publications)	3.893	973	973	973	973

7	Local project staff	2	Vinh Phuc/Quang Ninh	Part time

3. Reporting and monitoring arrangements

No.	Report	Deadlines for submission
1	Progress report (every 6 months)	30 June, 31 December
2	Annual work plan for subsequent year × 1	31 December
3	Financial status report including balance sheet, statement of cash flow and statement of	30 June, 31 December
4	Annual auditing report	31 January of the following year

4. Risk management and sustainability

4.1. Assumptions and risks

Assumptions and risks	Risk management strategy
The ability to flower and fruit of <i>P. caribaea</i> species is unstable leading to the shortage of high-quality seeds collected from seed orchards	Seeds of plus trees will be collected and prepared in advance
During the project implementation, model forests may be affected by natural disasters, forest fire or illegal tree cutting	<p>Forest fire prevention belt and trenches to prevent unexpected destruction will be set up.</p> <p>Sign boards to avoid external encroachment will be installed.</p> <p>Outsourced manpower will be hired to take care of model forests during the project implementation. These persons will be responsible for returning the model forests to the project owner when the project is completed.</p> <p>Relationship between local authorities and local people at the project sites will be built to get support from stakeholders.</p>

4.2. Sustainability

The project is based on the strategic objective of responding to and minimizing negative impacts of climate change. Particularly, it is of great importance to degraded land which will be continuously received due attention and investment from the Government as well local authorities and people, contributing to the sustainability of the project.

With the aim of rehabilitation and sustainable development of forests in the degraded regions, the project will make great contribution to the protection of ecological environment, limitation of erosion, maintenance and improvement of biodiversity which help create habitats for many species and reduce greenhouse gas emission. Moreover, rehabilitation and

sustainable development of forest ecosystem will bring about positive social values, especially when direct beneficiaries of the project are local communities. The project will generate jobs and income for local people and communities through their direct participation in forest plantation, rehabilitation and protection.

One of major objectives of the project is to improve the production and supply of high-quality *P. caribaea* seedlings to meet demands for forest plantation in the region. Hence, forests planted from high-quality seedlings on degraded land still retain as stable yield as those planted on other lands and ensure the provision of sustainable materials for timber processing and raw timber material industry.

Besides, infrastructures and facilities of FSNE and research institutes shall be maintained and promoted in *P. caribaea* seedling production as well as processing and production of *P. caribaea* timber in order to meet market requirements. FSNE's research staff are able to perceive technology and technical guideline and apply into production.

The project will help improve capacity of seedling management and sustainable forest plantation for FSNE's young staff, forestry officers and local people in the project area. Upon the project completion, model forests will be handed over to implementing units for protection, exploitation and utilization.
